

ICY Marina Management

Wireless management of your marina

With ICY Marina Management it is possible to remotely control and set the power points on your berths.

For a low investment you get a grip on the power consumption of your guests.

- Assigning Amp Limits wirelessly
- Limiting high consumption
- Reading of power consumption
- No adaptation to the infrastructure

Grip,
convenience
and
increased

We offer a choice of three different Campère appliances. All three have the same functions and contain everything you need to wirelessly connect your guest's power point to ICY Marina Management. In addition, all three devices are equipped with a kWh meter and Ampere limiter.

ICY4518CP Campère Plug

This plug can be placed in any existing CEE socket. The plug is then secured in the socket, so that it cannot be removed by your guest. The installation takes less than a minute per location.

ICY4518CM Campère Module

This module can be built into the control cabinet. The device is placed after the circuit breaker and can be mounted on a DIN rail.

We can supply completely new cabinets in which these modules are pre-assembled, but they can also be connected separately in your existing control cabinets.

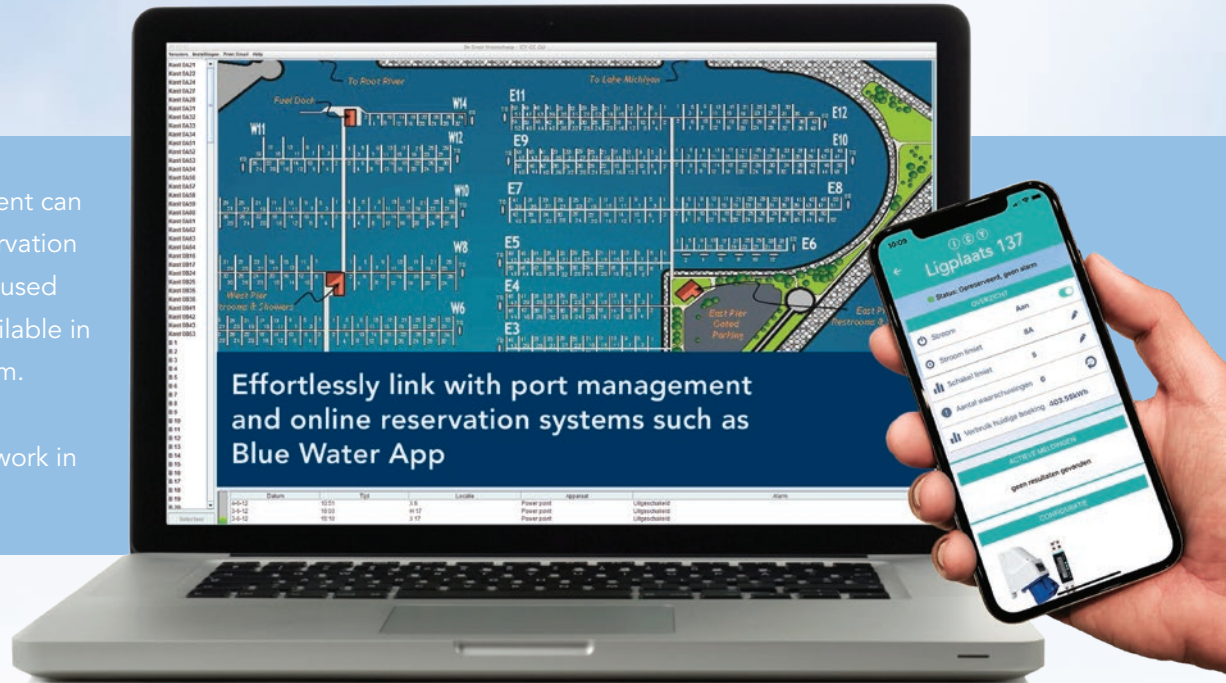

ICY4518WS Campère Wall Socket

This surface-mounted socket replaces the existing CEE socket.

Easy power management from your PC

ICY Marina Management can be linked to your reservation system. All frequently used functions are then available in your reservation system.

So you don't have to work in multiple screens.

Fair fee based on consumption

You can let your guests choose how much electricity they want to have available. For example: 6A, 12A or 16A.

You can then directly switch on the power point of the berth wirelessly and set it to that amount of power. If a guest uses too much power, he is automatically warned.

No more grid overload

Because the system tells you how much power can be supplied at a location, you prevent the electricity grid from being overloaded.

Energy meter reading per berth

This option makes it possible to charge actual electricity consumption per guest. This readout can be linked to your booking or administration software.

This is suitable for both short stay and long stay.

Prevent abuse of power points

To prevent improper use of power, you can switch off the power on a berth when there are no guests. This is fully automatic by means of the link with your reservation system.

Get more out of existing infrastructure

Because ICY Marina Management continuously monitors how much Ampere is available at your marina, you always know how much electricity you can still sell.

Were you only able to offer 6A per power point in the past? Now you can, for example, give 2 points 4A and another 10A, depending on the need at that moment, through smart distribution.

ICY Marina Management is modularly expandable with frost protection for the sanitary building, automatic water tapping, etc.
